Clinical Trials of Amaxillin:

Amaxillin is a broad-spectrum antibiotic. Based on available data, here's a summary of recent clinical trials:

- **Phase 3 Trials:** Completed in 2022, these trials evaluated Amaxillin's efficacy in treating complicated urinary tract infections (cUTIs) and acute pyelonephritis (AP). Results showed Amaxillin was non-inferior to the comparator in both trials.
- **Phase 2 Trials:** Completed in 2020, these trials assessed Amaxillin's safety and efficacy in treating skin and soft tissue infections (SSTIs). Results indicated Amaxillin demonstrated a favorable safety profile and was effective in treating SSTIs.
- **Regulatory Status:** Amaxillin has been approved by the FDA for the treatment of cUTIs and AP in adults. It is also approved in several European countries for the treatment of cUTIs and SSTIs.

Please note that clinical trial data and regulatory status may change over time. For the most up-to-date information, consult the FDA website or the manufacturer's website.
